Fall 2013 CENG 355

## Assignment 5 Due November 21, 12:59pm

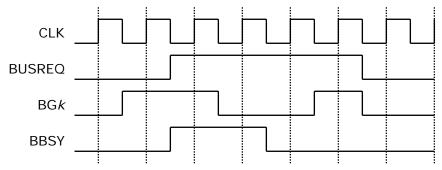

**NOTE:** Late submissions will **NOT** be accepted. Please put your solutions in the CENG 355 **drop-box** (ELW, second floor) – they will be collected at **13:00**.

- **1.** [7 points] Solve Problem **7.11** from the textbook.
- **2.** [3 points] Consider the following <u>Slave's protocol</u> in some handshake scenario: (1) Slave waits for Master to assert signal *REQ*; (2) Once *REQ* is received, Slave asserts signal *WAIT* for two clock cycles; (3) Once the two clock cycles have elapsed, Slave de-asserts *WAIT* and waits for Master to de-assert *REQ*; (4) Once *REQ* is removed, Slave goes back to step (1). Show the <u>Moore FSM</u> state diagram for this protocol. **Note:** *WAIT* is asserted only in step (2).
- **3.** [10 points] Consider the state diagram shown on **Slide 41** of the "Interfacing" lecture notes. Assume that the circuit is initially in state Idle. Given the following two input waveform scenarios, show the corresponding <u>output waveforms</u>.

## Scenario A:

## Scenario B:

**4.** [5 points] Consider the <u>daisy-chain</u> arbitration scheme shown below. Assume that the input-to-output signal propagation delays are the same and equal to **d** for all three devices, the inverter, and the **AND** gate. Also, assume that device **x** is able to start using the bus (making /BRx = 1 and /BBSY = 0) only when it receives a <u>0-1 transition</u> on its bus-grant input **BGx** and detects that the bus is not currently busy (i.e., /BBSY = 1). Also, assume that device **x** lets the bus-grant propagate through only when it is neither requesting nor using the bus. Finally, assume that any of the three devices will need to use the granted bus for only **3d** time units. Complete the <u>timing diagram</u> below, where <u>Device 2</u> requests the bus at time **t** = **0**, and <u>Device 3</u> requests the bus at time **t** = **6d**.
